It exhibits a ribonuclease-like activity against high molecular weight ribosomal RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                      -!- DEVELOPMENTAL STAGE: Barly embryos (up to four blastomere stage)
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

                                                                                                                                                                                 J. Biochem. 108:139-143(1990).
-!- FUNCTION: The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin preferentially agglutinate a large variety of tumor cells, but does not agglutinate non-transformed cells and erythrocytes.
-!- SUBUNIT: Monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     kana catespelana (BULL 1709).

pancreatic ribonuclease (EC 3.1.27.5) B - guinea pig (tentative sequence)
NyAlternate names: RNase IB
C;Species: Cavia porcellus (guinea pig)
C;Species: Cavia porcellus (guinea pig)
C;Date: 24-Apr-1984 #sequence_revision 24-Apr-1984 #text_change 31-Mar-2000
C;Accession: A00826
R;van den Berg, A.; van den Hende-Timmer, L.; Hofsteenge, J.; Gaastra, W.; Beintema, J.J
Eur. J. Biochem. 75, 91-100, 1977
A;Title: Guinea pig pancreatic ribonucleases. Isolation, properties, primary structure a A;Reference number: A91247; MUID:77188023; PMID:862624

A; Molecule type: protein A; Residues: 1-128 <VAN> A; Note: 64-Pro was also found

C;Superfamily: pancreatic ribonuclease C:Keywords: glycoprotein; hydrolase; nucleic acid digestion; pancreas F;12,41,119/Active site: His, Lys, His #status predicted F;21,34/Binding site: carbohydrate (Asn) (covalent) #status experimental F;26-84,40-95,58-110,65-72/Disulfide bonds: #status predicted

pancreatic ribonuclease - common iguana
C;Species: Iguana iguana (common iguana)
C;Decies: 19.mar-1997 #sequence_revision 19-mar-1997 #text_change 21-Aug-1998
C;Accession: S41111
R;Zhao, W; Beintema, J.J.; Hofsteenge, J.
Bur. J. Biochem. 219, 641-646, 1994
A;Title: The amino acid sequence of iguana iguana) pancreatic ribonuclease.
A;Reference number: S41111; MJID:94139745; PMID:8307028
A;Accession: S41111
A;Actus: preliminary
A;Molecule type: protein
A;Residues: 1-119 <ZHA>
C;Superfamily: pancreatic ribonuclease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pancreatic ribonuclease (EC 3.1.27.5) - red kangaroo
N.Alternate names: RNase 1; RNase A
N.Alternate names: RNase 1; RNase A
C.Species: Macropus rufus, Megaleia rufa (red kangaroo)
C.Date: 30-Nov-1980 #sequence_revision 30-Nov-1980 #text_change 04-Oct-1996
C.Accession: A00833
R.Gaastra, W.; Welling, G.W.; Beintema, J.J.
Blochem. 86, 209-217, 1998
A.Title: The amino-acid sequence of kangaroo pancreatic ribonuclease.

pancreatic ribonuclease (EC 3.1.27.5) - minke whale pancreatic ribonuclease (EC 3.1.27.5) - minke whale placestate names: RNase 1; RNase A C; Species: Balaenoptera acutorostrata (minke whale, lesser rorqual) C; Species: Balaenoptera acutorostrata (minke whale, lesser rorqual) C; Species: Balaenoptera acutorostrata (minke whale, lesser rorqual) Balaets: 24-Apr-1994 #text_change 03-Jun-1994 C; Accession: A00818 R; Emmens, M.; Welling, G.W.; Beintema, J.J. Biochem, J. 157, 317-323, 1976 A; Title: The amino acid sequence of pike whale (lesser rorqual) pancreatic ribonuclease. A; Reference number: A00818; MUID: 76277855; PMID: 962870 A; Reference number: A00818 A; Accession: A00818 A; Accession: A00818 A; Accession: A00818 A; Accession: A00818 A; Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accession: Accessi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Description: hydrolyzes tRNA; induces vascularization of normal and malignant tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          33 CKRVNTFIISSATTVKAICTG-----VINLNVLSTTRFQLNTCTRISITPR-PCPYSSRT 86

Sequence 1, Application US/09687748

Patent No. 6433515

GENERAL INFORMATION:
APPLICANT: Saxena, Shailendra K

TITLE OF INVENTION: METHODS OF MAKING NUCLEIC ACIDS ENCODING RIBONUCLEASES
FILE REFREENCE: 5013 US 01

CURRENT APPLICATION NUMBER: US/09/687,748

CURRENT PILING DATE: 2000-10-14

PRIOR APPLICATION NUMBER: 09/394,268

PRIOR FILING DATE: 1999-09-10

NUMBER OF SEQ ID NOS: 8

SOFTWARE: Patentin Ver: 2.0

This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana pipiens occytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to
                                                                                                                                                                                                                                                                                                                                                                              Recombinant Onc protein with glutamine residue at position 1 - useful as antitumour and antiviral agent, also as cell culture selection agent.
                                                                                                                                                                                                                                                                                                                                                                                                            59 VLSTTRFQLNTCTRISITPRPCPYSSRTETNYICVKCENQYPVHFAGIGRC 109

                                                                                                   New nucleic acids encoding a ribonuclease (Rnase), useful for the precise targeting of Rnase to a predetermined cell receptor.
                                                                                                                                                                                        The present sequence represents a modified frog ribonuclease protein (ranpinnase) (RNase). The synthetic ribonuclease comprises a cysteine which facilitates the chemical linking of a targeting molecule by the single reactive sulfhydryl group. The specification describes a method processing broduction of ranpinnase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for the ribonuclease to be delivered to a particular cell receptor where it might be most effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    56

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI). Protein with Met at position 1. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

```
The present sequence is a Rana pipiens Clone Salb ribonuclease (RapLRI). It is encoded by Clone Salb CDNA obtained from Rana pipiens liver mRNA library. It exhibits differences with Oncomase (RTM) at amino acid covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic spanish choice against Choice against Kaposi's Sarcoma cells. Recombinant inconcleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to proteins to proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 QNWATFQQKHIINT-PIICNTILDNNIYIVGGQCKRVNTFIISSATTVKAICTGVI-NLN 58

```
The present sequence is Rana pipiens liver ribonuclease (RaPLR1) protein. Carboxy terminal end of RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadorrophin (MCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moietles to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                                                                                                            Rana pipiens liver ribonuclease; RaPLR1; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; Kaposi's Sarcoma; frog; human chorionic gonadotrophin; hCG; recombinant ribonuclease; RNase; signal peptide; cytotoxic fusion protein; cancer; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a recombinant Rana pipiens ribonuclease protein (RapERI) with Met at position 1 attached to (His)6 tag and Met24Leu. Carboxy terminal end of recombinant RapERI has a covalently bound ligand binding molety, which can be a LL2 antibody directed against CD22 or cancerous B cells or human chorionic gonadorrophin (hC3) effective expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moleties to form ovtotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

This is one of two preferred proteins (the other in AAW06543) that have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the

Recombinant Rana pipiens ribonuclease; RaPLR1 Met23Leu, covalently bound; LLZ antibody; ligand binding moiety; CD22; cancerous B cell; RNase; Kapoal's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met23Leu. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

```
The present sequence is a recombinant Rana catesbeiana ribonuclease (RacORI) protein with Met at position 1 and Gln2Ser. Carboxy terminal of recombinant RacORI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

This invention describes a novel nucleic acid construct comprising sequences encoding functional pancreatic RNase and a second protein (preferably the light and heavy chains of an antibody) which binds a specific cell surface marker on a target cell and functions as a vytotoxix agent. The products can be used for selectively killing cells expressing a specific surface marker. They can be used for treating tumors or infected cells (e.g. cells infected by viruses (especially latent or chronic virus infections, such as human immunodeficiency virus (HV)-1, Epstein-Barr virus, herpes viruses (herpes simplex types I and II), hepatitis viruses (B, non-A-non-B, and delta), herpes zoster, cytomegalovirus) and cells infected with parasites (such as the malaria parasite)). They can also be used for treating immune dysfunctional cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           marrow) prior to transplantation into a patient undergoing marrow ablation by radiation or for killing leukemia cells or T-cells that would cause graft-versus-host disease. This sequence represents a bullfrog

Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form expression proteins. They can be used for treatment of cancer and

Met(-1) Rana catesbeiana ribonuclease Met22Leu Met57Leu-(His)6; RaCOR1; recombinant; CD22; covalently bound; LL2 antibody; ligand binding moiety; cancerous B cell; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein;
which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic tusion proteins. They can be used for treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      'note= "(His)6 histidine tag attached to N-terminal Met"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

The present sequence is a Rana catesbelana oocyte ribonuclease (RacOR1) protein encoded by a cDNA modified for expression in E. coli. Carboxy terminal end of RacOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an
The present sequence is a recombinant Rana catesbeiana oocyte ribonuclease (RaCOR1) protein with Met at position 1 attached to a (His)6 tag, Met23Leu and Met5BLeu. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moietry, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic gonadotrophin (hcG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

for e.g. New recombinant ribonucleases, used for killing target cells, treating cancers, viral infections or autoimmune diseases.

Claim 22; Page 64; 71pp; English.

The present sequence is a recombinant Rana catesbeiana oocyte ribonuclease (RaCOR1) protein with Met22Leu Met57Leu. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety,

"An angiogenic protein from bovine serum and milk -- purification and primary structure of angiogenin-2.";

Eur. J. Biochem. 247:535-544(1997).

Eur. J. Biochem. 247:535-544(1997).

-! FUNCTION: Binds tightly to placental ribonuclease inhibitor and as very low ribonuclease activity. Has potent angiogenic activity. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs.

-! TISSUE SPECIFICITY: Serum and milk.

"Sequences related to the ox pancreatic ribonuclease coding region in
the genomic DNA of mammalian species.";
J. Mol. Evol. 37:29-35(1993).
-: SUBCELLUIAR LOCATION: Secreted.
-: SIMILARITY: Belongs to the pancreatic ribonuclease family.
-: SIMILARITY: Belongs to the pancreatic ribonuclease family.
-: SIMILARITY: Belongs to the pancreatic ribonuclease family.

J. Biochem. 219:641-646(1994).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2', 3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TASUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

Biol. Chem. 245:654-661(1970).

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphate intermediates.

-!- SUBCELDULAR LOCATION: Secreted.
-!- SUBCELDULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Jackson R.L., Hirs C.H.W.;

Biochim. Blophys. Acta 1162:177-186(1993).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs.

-!- SUBCELLULAR LOCATION: Secreted.

-!- FUNCTION: Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Endonuclease; Angiogenesis;
hibitor; Signal; Pyrrolidone carboxylic acid.

J. 157:317-323(1976).

Biochem. J. 157:317-323(1976).

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphooligonucleotides ending in C-P or U-P
with 2',3'-cyclic phosphoel intermediates.

-!- SUBCELIULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Pancreas.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Emmens M., Welling G.W., Beintema J.J.; "Emens M., Welling G.W., Beintema J.J.; "The amino acid sequence of pike-whale (lesser-rorqual) pancreatic

        -!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphooligonucleotides ending in C-P or U-P with 2',3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

```

```
-!- FUNCTION: Basic protein with antiproliferative/cytotoxic activity against several tumor cell lines in vitro, as well as antitumor in vitro. It exhibits a ribonuclease-like activity against high "vitro lide with stranger a ribonuclease-like activity against high "C -!- DEVELOPMENTAL STAGE: Early embryos (up to four blastomere stage). C -!- SIMILARITY: Belongs to the pancreatic ribonuclease family. RDB: 10NC; 31-JAN-94.

residues with a 3'flanking guanine. Hydrolyzes poly(U) and poly(C) as substrates, and prefers the former. The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin agglutinates various animal cells, including normal lymphocytes, erythrocytes, and fibroblasts of animal and human origin. It is cytotoxic against several tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

SwissProt_42:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

parcreatic ribonuclease (EC 3.1.27.5) B - guinea pig (tentative sequence)

NAAlternate names: RNase IB
C;Species: Cavia porcellus (guinea pig)
C;Date: 24-Apr-1984 #sequence_revision 24-Apr-1984 #text_change 31-Mar-2000
C;Accession: A00826
C;Accession: A00826
Bur. J. Biochem. 75, 91-100, 1977
A;Title: Guinea pig pancreatic ribonucleases. Isolation, properties, primary structure a A;Reference number: A91247; MuID:77185023; PMID:862624

A, Molecule type: protein
A, Residues: 1-128 < VAN.
A, Residues: 1-128 < VAN.
A, Note: 64-Para at also found
C, Superfamily: pancreatic ribonuclease
C, Keywords: glycoprotein; hydrolase; mucleic acid digestion; pancreas
F, 12, 4, 119/Active site: His, Lys, His #status predicted
F, 21, 34/Binding site: carbohydrate (Asn) (covalent) #status experimental
F, 26-84, 40-95, 58-110, 65-72/ pisulfide bonds: #status predicted
